

Genetic Testing for Prostate Cancer: a Delphi Study

Researchers at the University of Queensland are conducting a study about **genetic testing for prostate cancer**. They would like you to participate in a Delphi study (2 rounds) to measure consensus among Australian health providers and consumers (patients and carers) about genetic testing recommendations for prostate cancer reported in current international guidelines.

You will be asked to complete an online survey, where you state your level of agreement with different genetic testing recommendations for the Australian setting. For each recommendation, you will need to consider its benefits and feasibility in Australia. You will be contacted by email to participate in the second round.

If you would like to participate, scan the QR code below to go to the survey:
(a link to the participant information sheet is provided within survey)
